SUMMARY

Full-stack software engineer transitioning into Solutions Engineering, bringing 5+ years of hands-on experience building customer facing and enterprise applications, with a proven track record of bridging technical complexity and business outcomes through stakeholder demos, requirements scoping, and solution delivery.

WORK EXPERIENCE

Wells Fargo **Apr. 2025 – Present**

Software Engineer II *Charlotte, NC*

- Delivered technical demonstrations to business stakeholders, translating complex application capabilities into clear value propositions that drove alignment on product goals and solution design
- Designed and developed the SUP application for the Cyber Threat Portal, enabling customers to automate SaaS application risk scoring and eliminating manual security workflows
- Championed and led the full rewrite of a legacy Angular application to a modern React based architecture, accelerating delivery speed and improving the end user experience
- Authored JavaScript scripts to batch migrate application data to a new MongoDB record structure, ensuring zero data loss during a critical platform transition
- Built a cross application integration module enabling users to map SSRMs to CCO records, unlocking shared data access across two platforms and improving reporting accuracy for stakeholders
- Served as a technical advisor during sprint refinement, bridging the gap between business requirements and engineering constraints to ensure solutions delivered measurable outcomes

General Motors **Feb. 2022 – Aug. 2024**

Software Engineer *Remote*

- Built and owned the customer address validation flow for Connective Incentives, a dealer facing tool used by every user at the start of each session, collaborated directly with the business team to define the end to end logic based on API response codes from a third party validation service, mirroring the discovery and requirements scoping work of a pre-sales engagement
- Designed and delivered the RPO page, transforming a deeply nested, duplicate heavy vehicle data structure into a clean, performant UI table, enabling dealers to quickly identify unique option combinations tied to a specific VIN and accelerating their incentive selection workflow
- Developed features and resolved defects across the Connective Incentives application, a React based dealer portal surfacing VIN specific incentive data to General Motors' dealership network
- Integrated with RESTful backend services to consume and display vehicle and incentive data across the frontend, supporting a platform that managed 81,000+ vehicle deliveries
- Regularly demoed new features and bug fixes to business stakeholders, presenting technical changes in terms of user impact and gathering requirements for subsequent iterations

Marquis Software Development **Jan. 2021 – Feb. 2022**

Software Engineer *Tallahassee, FL*

- Developed new features based on business needs, involving planning, requirement refinement, testing, and deploying code to production

SKILLS

JavaScript, TypeScript, React, Node.js, REST APIs, GraphQL, JSON, Microservices, MongoDB, SQL, AWS, Azure, Cloudflare Workers, Git, CI/CD, Jest, Integration Architecture, Technical Discovery, PoC Development, Solution Presentation, Requirements Analysis, Stakeholder Communication, Pre-Sales Support

EDUCATION

Florida State University **July, 2021**

Bachelor of Science, Information Technology *Tallahassee, FL*
